JUNIOR – klasa I liceum (i równorzędne)

Czas trwania konkursu: 45 min.

Witamy Cię. Otrzymujesz od nas 112 punktów – tyle ile masz decyzji do podjęcia. Za każdą poprawną odpowiedź dopisujemy Ci jeszcze 1 punkt, za błędną zabieramy dany punkt. Gdy nie odpowiadasz, zachowujesz podarowany punkt. Pamiętaj, że każda z odpowiedzi A, B, C, D może być fałszywa lub prawdziwa. W czasie konkursu nie wolno używać słowników, notatek, podręczników itp...

Życzymy przyjemnej pracy. Zapraszamy do konkursu ENGLISH ACE 2012. Powodzenia!

IQ Is Not Fixed in the Teenage Brain, based on Science Magazine

A new study 1) what parents have long suspected: Adolescence can do a number on kids' brains. Researchers have found that IQ can 2) or fall during the teen years and that the brain's structure reflects this uptick or decline. The result offers the first direct 3) that intelligence can change after early childhood and provides new hope for boosting the brain's abilities.

4) researchers debate what IQ tests actually measure, they agree that scores can predict our ability to learn and perform certain tasks, and to some degree 5) our later academic achievement and job performance. Scores have long been thought to stay relatively stable 6) our lives; the few studies that have shown some variation in IQ could not rule out measurement errors or differences in testing environment as the cause.

So neuroscientist Cathy Price of University College London and 7) looked beyond the scores. They tested 33 teenagers in 2004 and again in 2008. Each time, the teens took IQ tests that measured their verbal and nonverbal abilities. The test results 8) dramatic changes: between their first testing and their second, the teens' IQ scores rose or fell by as many as 20 points (on a scale for which the average is 100). Some teens improved or declined in just their verbal or nonverbal skills or improved in one area and declined in the other.

Space Weather Forecasters Get Serious, based on Science Magazine

It took a while, but space physicists who predict 1) balls of solar debris smashing into Earth have finally caught up with their brethren who forecast terrestrial weather. Rather than simply 2) rules of thumb, space weather forecasters have begun running a computer model that actually simulates the development of conditions between the Sun and Earth. They're following the lead of atmospheric weather forecasters, who 3) computer models since the 1960s. Warnings of when solar storms will strike Earth are already much improved.

The better the warning of major solar storms, the better earthlings can prepare for the 4), which can include electrically fried satellites, degraded GPS navigation, and widespread blackouts. The 5) is a magnetic bubble of tens of millions of tons of protons and the like blown off the sun at several million kilometers per hour. It might seem easy enough to 6) something that big, but observation platforms between the sun and Earth are few and far between. And the choppy sea of magnetic fields and charged particles that the ejected bubbles plow through can slow and deflect the bubbles.

7) the typical behavior of previous bubbles, called coronal mass ejections (CMEs), forecasters at the National Oceanic and Atmospheric Administration's Space Weather Prediction Center (SWPC) in Boulder, Colorado, had been predicting the arrival of CMEs at Earth with 8) of plus or minus 15 hours. They would usually say which day a storm might strike but not much more.
